ABSTRACT OF THE DISCLOSURE

A fruit juice extraction apparatus comprising: a chassis having mounted thereon a juice extractor which has a container for storing the fruit, the container  
5 having an aperture therein for allowing articles of fruit to be deposited between two concave hemispheres; drive motor for actuator for forcing the first concave hemispheres against the second concave hemispheres, thereby pressing an article of fruit deposited between  
10 said hemispheres; the first concave hemisphere having a central pin and the second concave hemisphere a perforating tube for the extraction of juice from said article of fruit, whereby the solid residue is deposited in a receptacle and the liquid is passed through a filter  
15 and then falls into a reservoir which has outlet ports therein, the perforating tube having multiple transverse slits of increasing diameter from inside to outside.
